DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 19-38 are rejected under 35 U.S.C. 103(a) as being unpatentable over WO-A-96/10775 ('775) in view of 5,549,568 ('568).

Per claim 19-22 and 24-38, '775 teaches the claimed invention except for the optical retardation layer is biaxial retardation layer with different refractive indices such that n_z applies along an axis of retardation layer which is essentially parallel to the normal line of the liquid crystal cell. However, '568 teaches such a configuration for the benefit of reduced inversion and improved contrast ratios. Accordingly, it would have been obvious to one of ordinary skill at the time the invention was made to combine the biaxial configuration of '568 with the cell of '775 in order to improve contrast and decrease inversion.

Per claim 23, '775 in view of '568 lack the retarder placed between the liquid crystal and substrate. However, it was well known to place the compensator in this way in order to decrease cell thickness. Accordingly, it would have been obvious to one of ordinary skill at the time the invention was made to the well known placement and '568 in order to decrease cell thickness.
